Overall Network View

An example of a multi-container pod with two services sending traffic to its ephemeral IP can be seem in the diagram below. The diagram also shows an ingress controller, which would typically be represented as a pod, but has a different shape to show that it is listening to a high numbered port of an interface and is sending traffic to a service. Typically, the service the ingress controller sends traffic to would be a ClusterIP, but the diagram shows that it would be possible to send traffic to a NodePort or a LoadBalancer.

Example of Cluster Networking
